

# **Interactions between several loci, Epistasis, Super Genes, Pleiotropy**

**Virginie Courtier-Orgogozo  
Institut Jacques Monod, Paris**

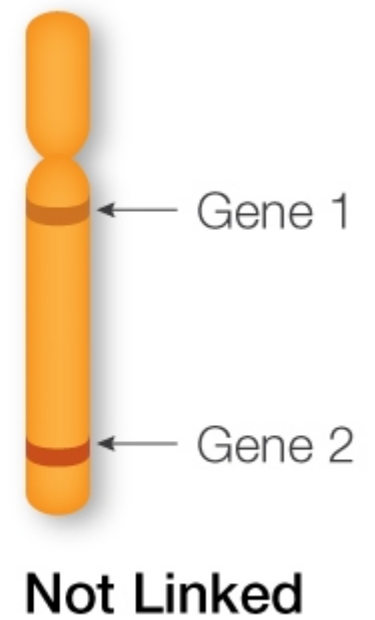

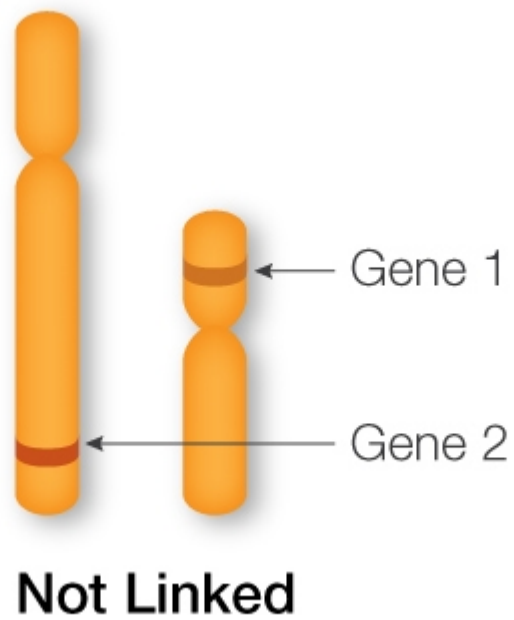

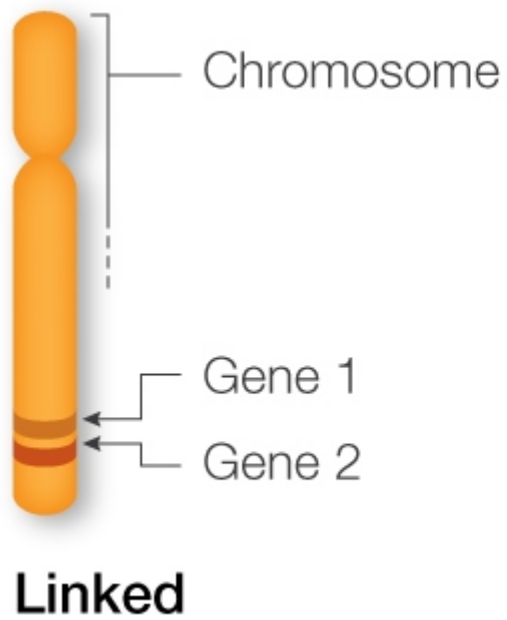

# **Genetic Linkage**

---

# Crossing overs

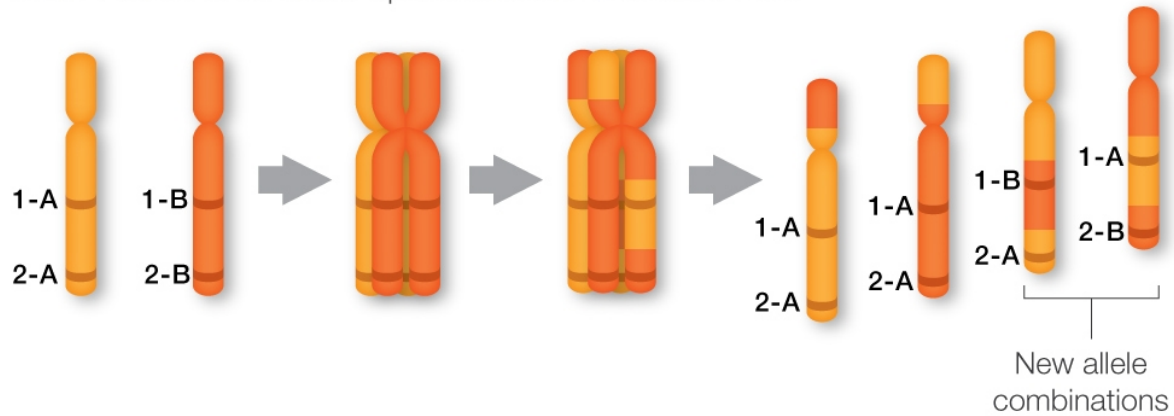

About one recombination event per chromosome arm

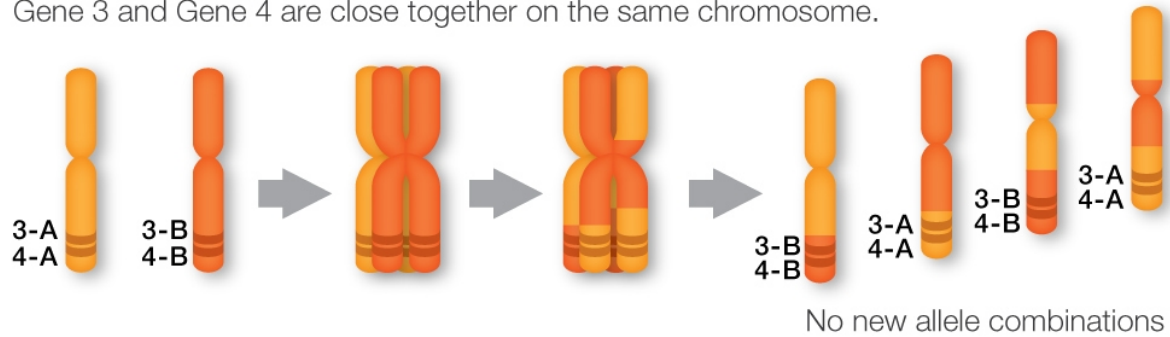

## Not Linked

Gene 1 and Gene 2 are far apart on the same chromosome.

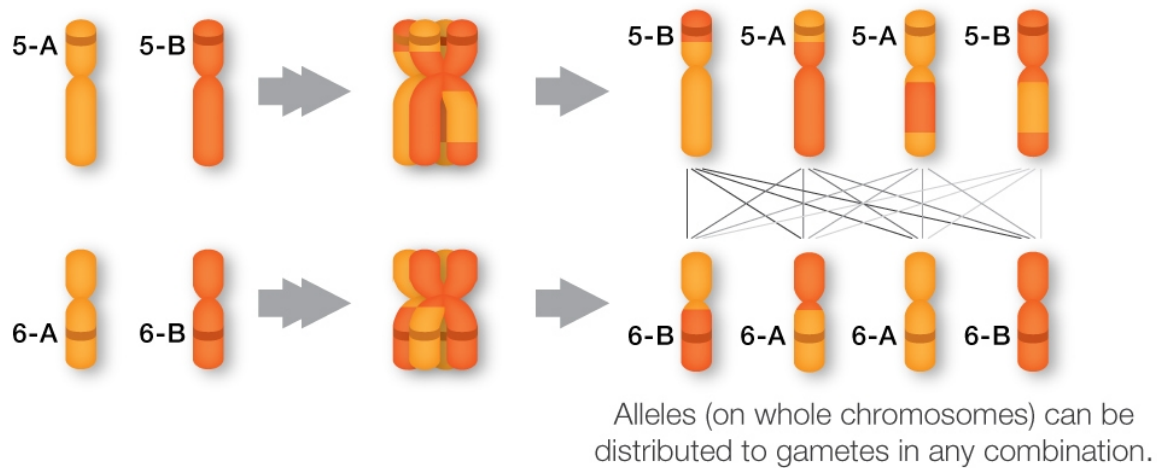

## Linked

Gene 3 and Gene 4 are close together on the same chromosome.

## Not Linked

Gene 5 and Gene 6 are on separate chromosomes.

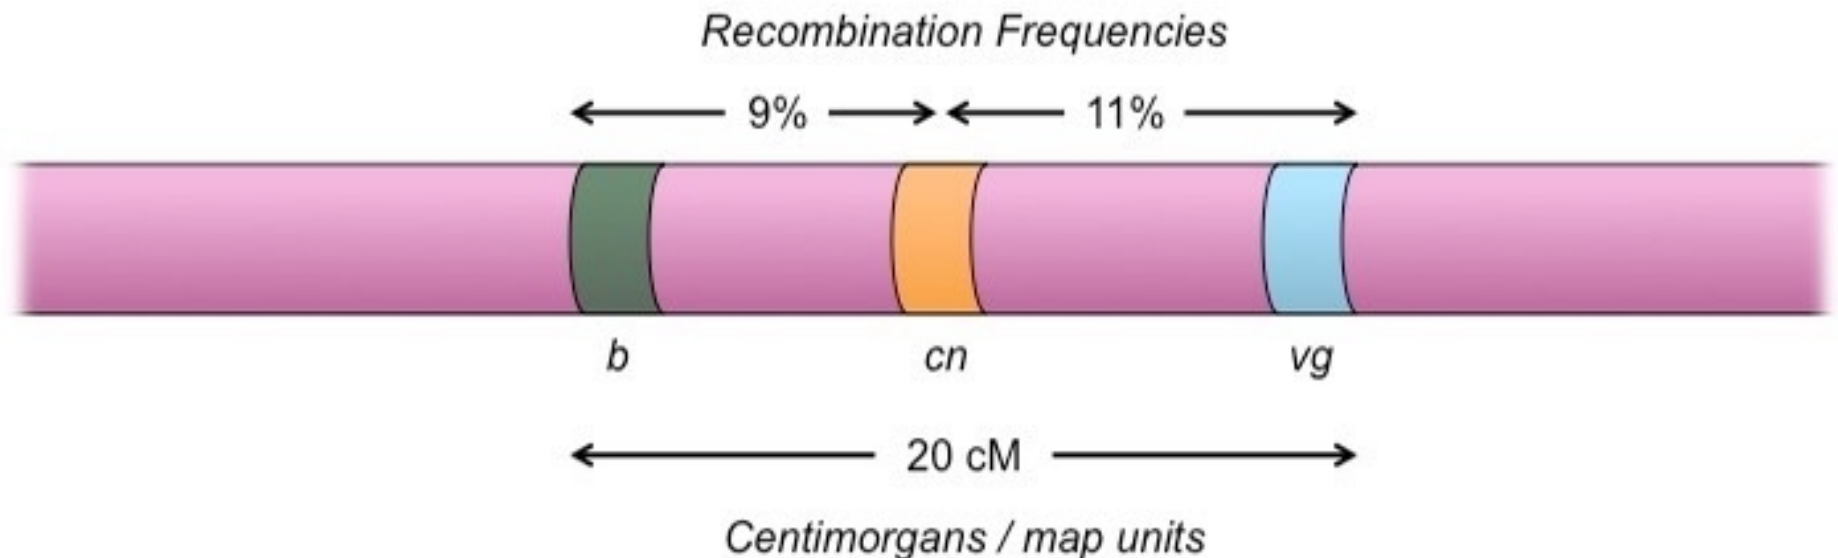

One “centiMorgan”

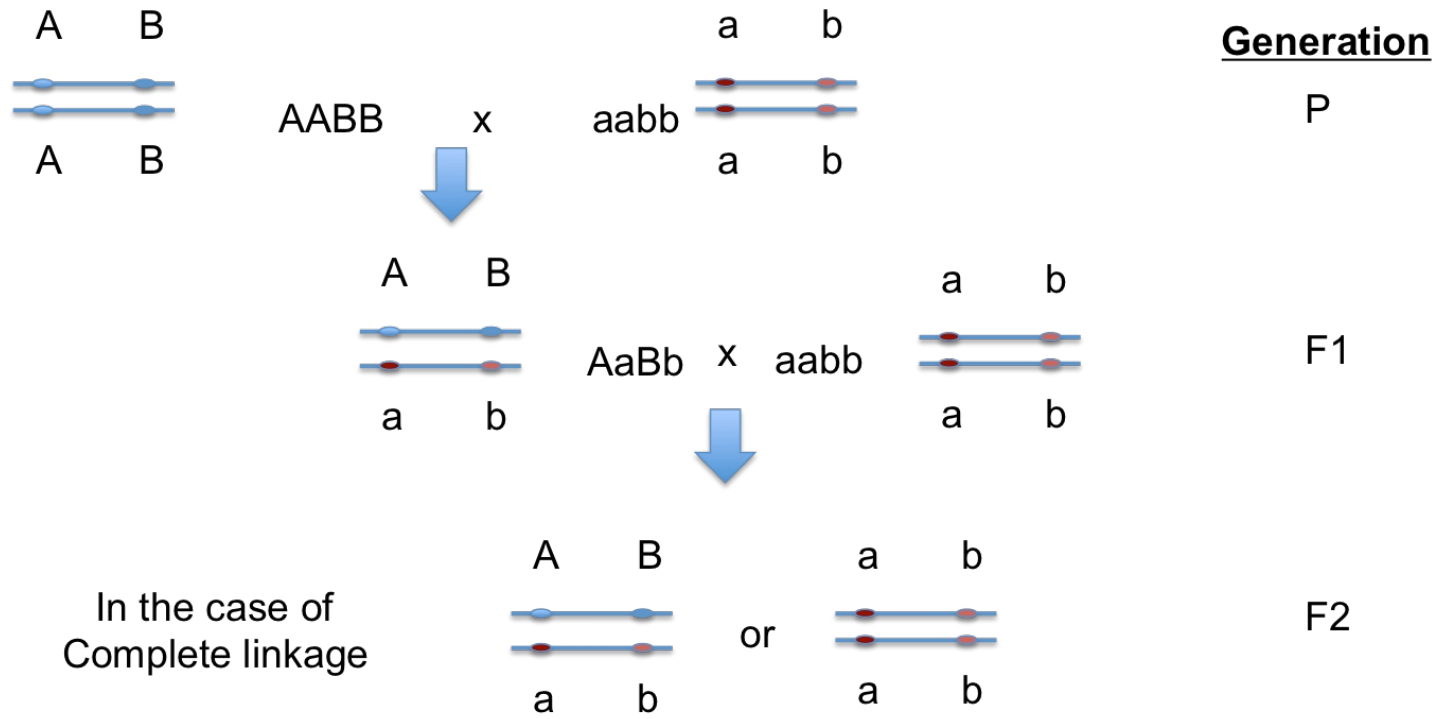

= genetic distance that produces a recombination frequency of 1%

Genetic distance (in cM)

$$= \frac{(\# \text{ Recombinant gametes}) \times 100}{\text{Total gametes}}$$

# Measure of genetic linkage

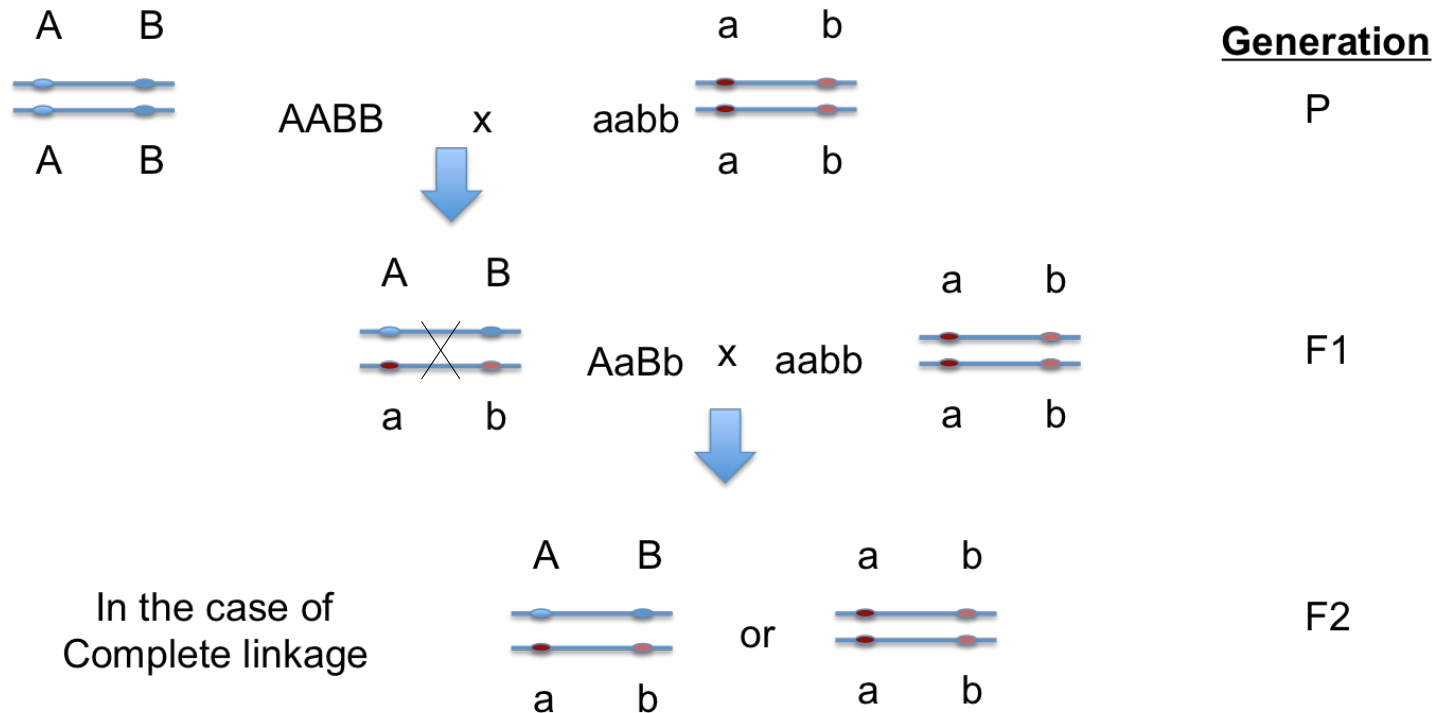

## Complete Linkage

50% AaBb

50% aabb

# Measure of genetic linkage

## Complete Linkage

50% AaBb  
50% aabb

## Genetic Linkage

40% AaBb  
10% Aabb  
10% aaBb  
40% aabb

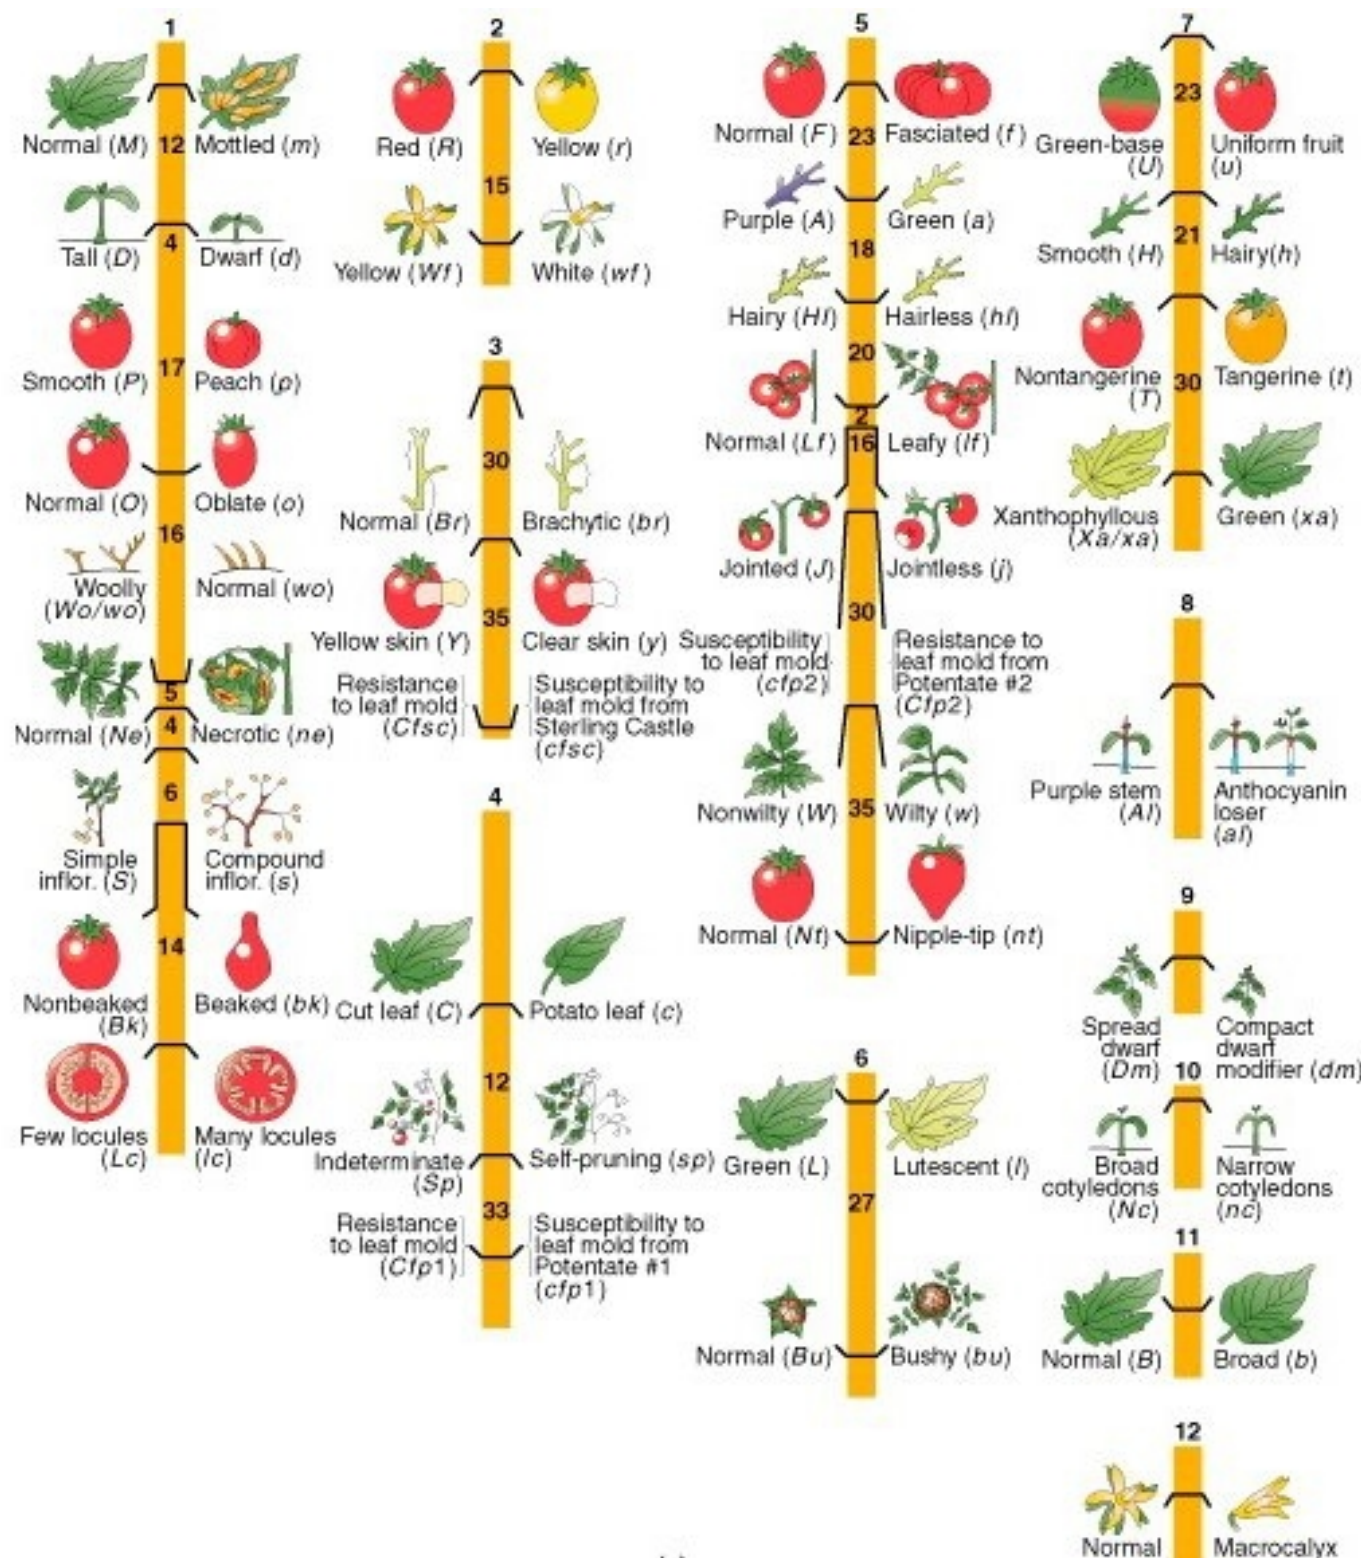

20% of recombinants so 20cM

# Measure of genetic linkage

If  $y$  % recombinant gametes and  $y < 50\%$   $\Rightarrow y$  cM apart

Due to double cross-overs and cross-over interference, genetic distances need corrections when long and are not fully additive

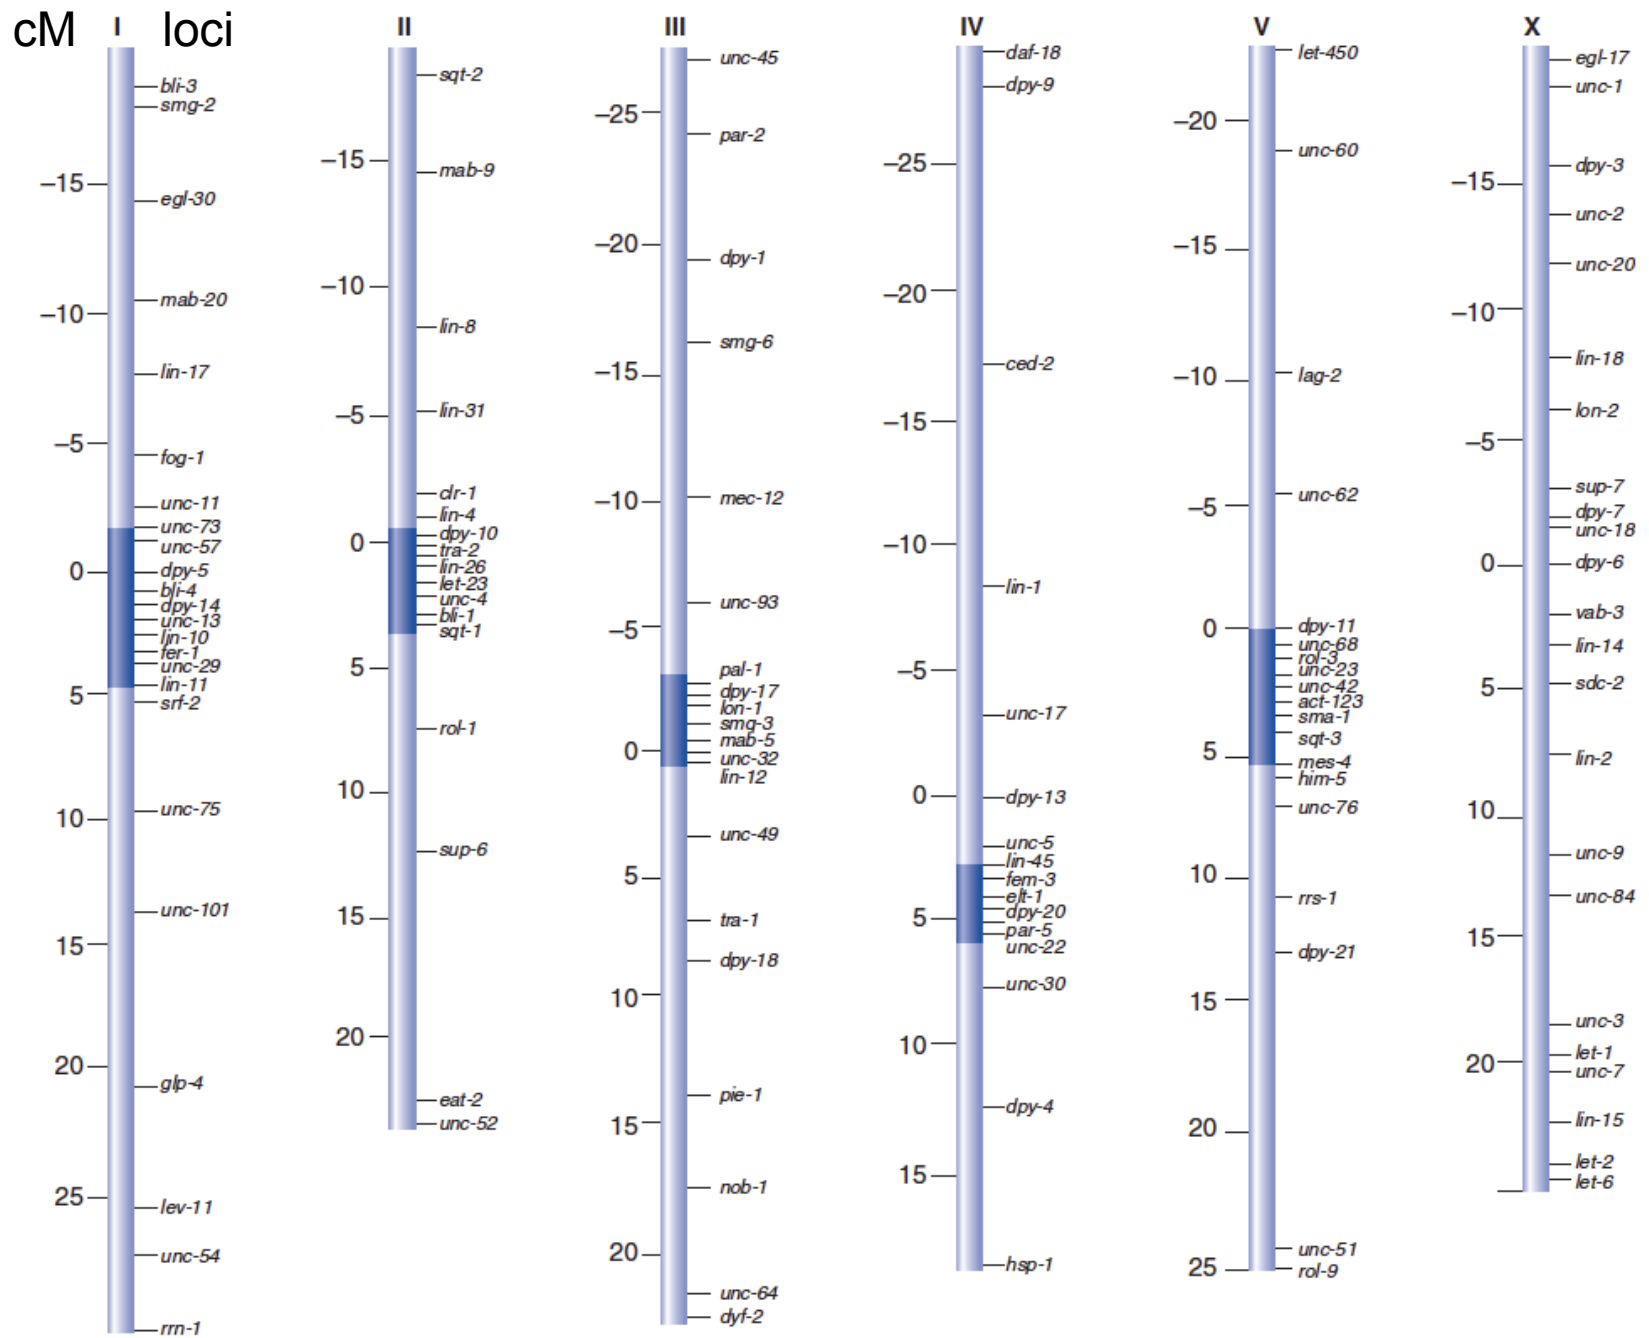

If the linkage group is longer than 50 cM, mutations at the two extremities are operationally unlinked

# Genetic map

in units of recombination

1 centiMorgan (cM)  
= 1% recombinants

# Genetic Markers

Mark the region of interest through genetic linkage

Are not causal (or only rarely) for variation in the phenotype of interest

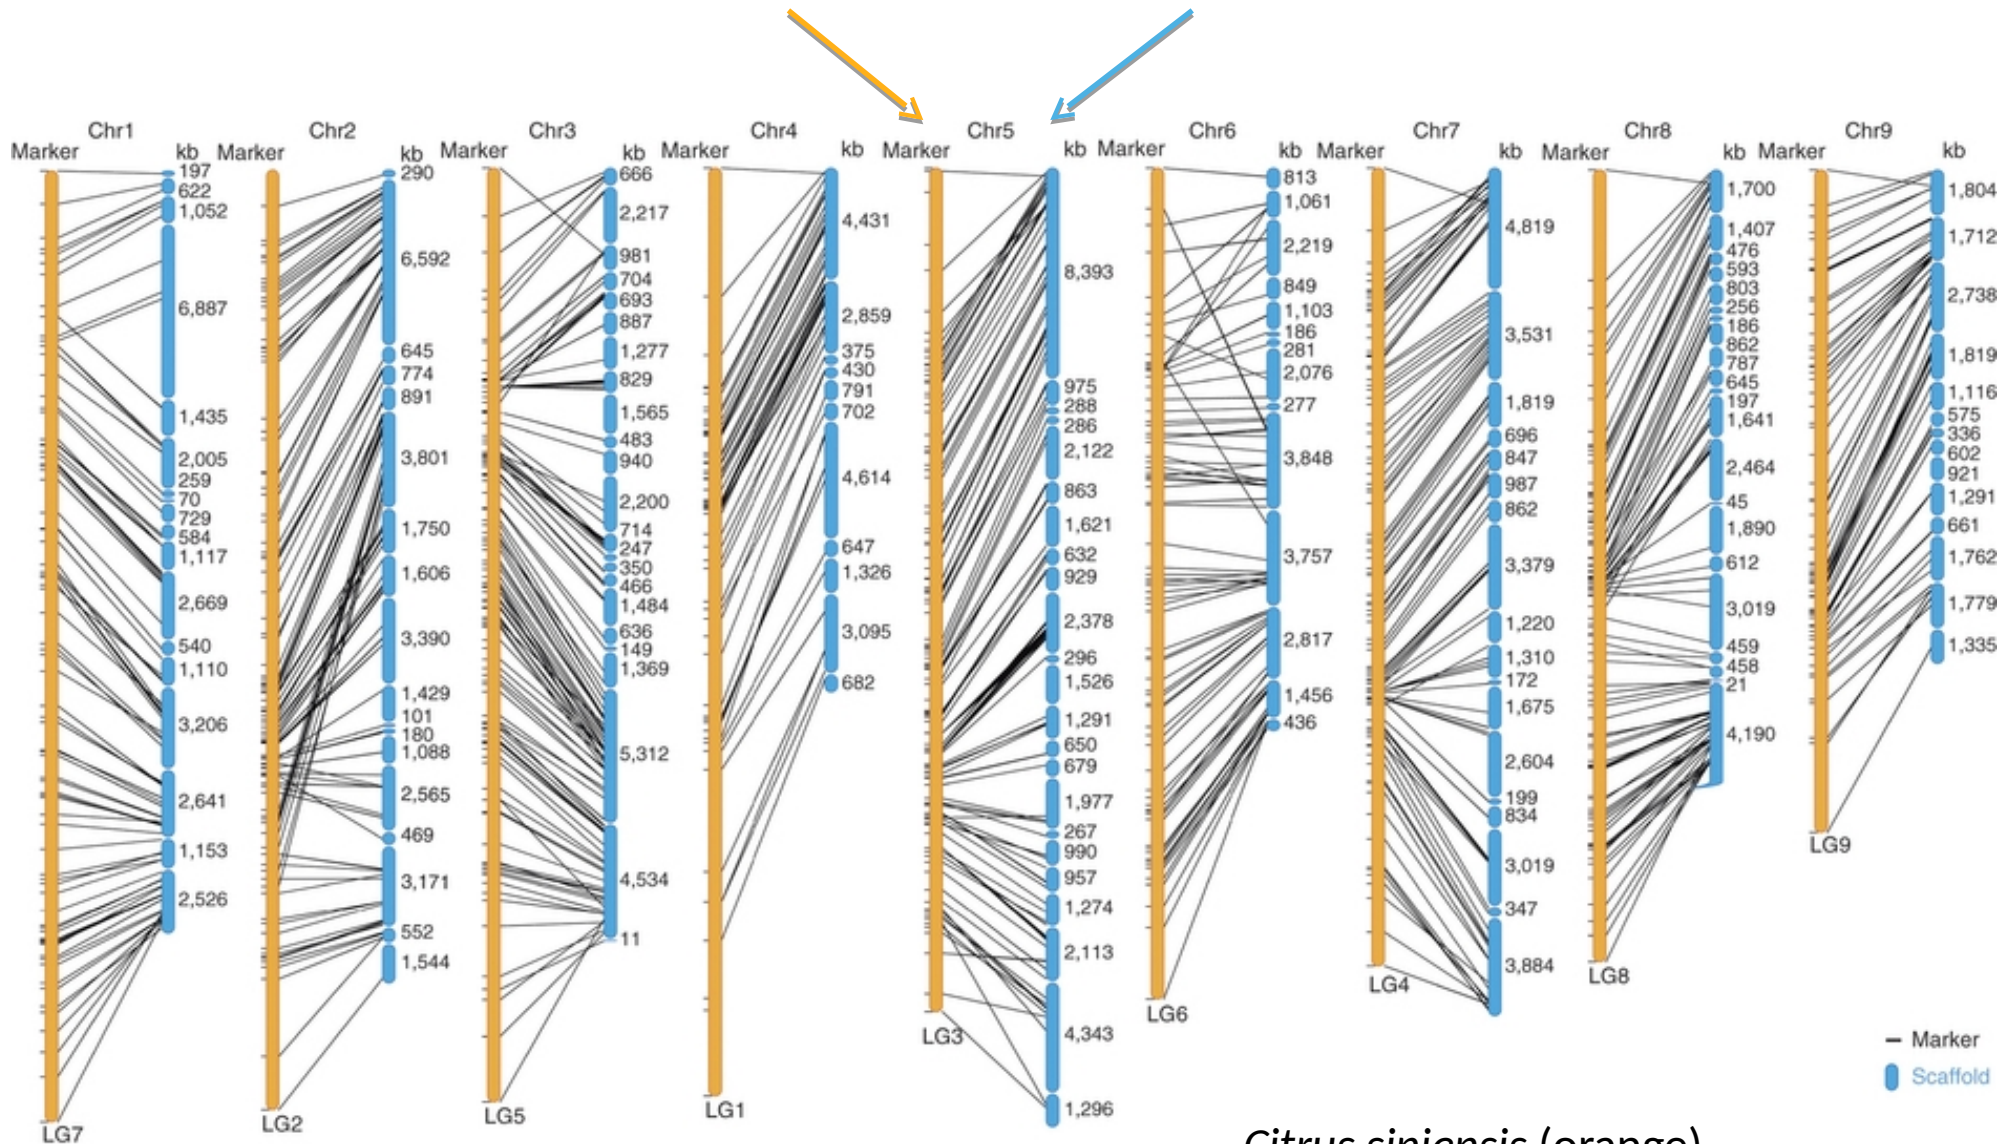

Detected:

- through their phenotypic effect:  
white eyes, dumpy shape, GFP marker
- molecularly: PCR, sequencing  
transposon insertion, single-nucleotide polymorphism (SNP), indel

# Alignment of genetic and physical maps

Genetic map in units of recombination  
1 centiMorgan (cM) = 1% recombinants

Physical map in base pair units

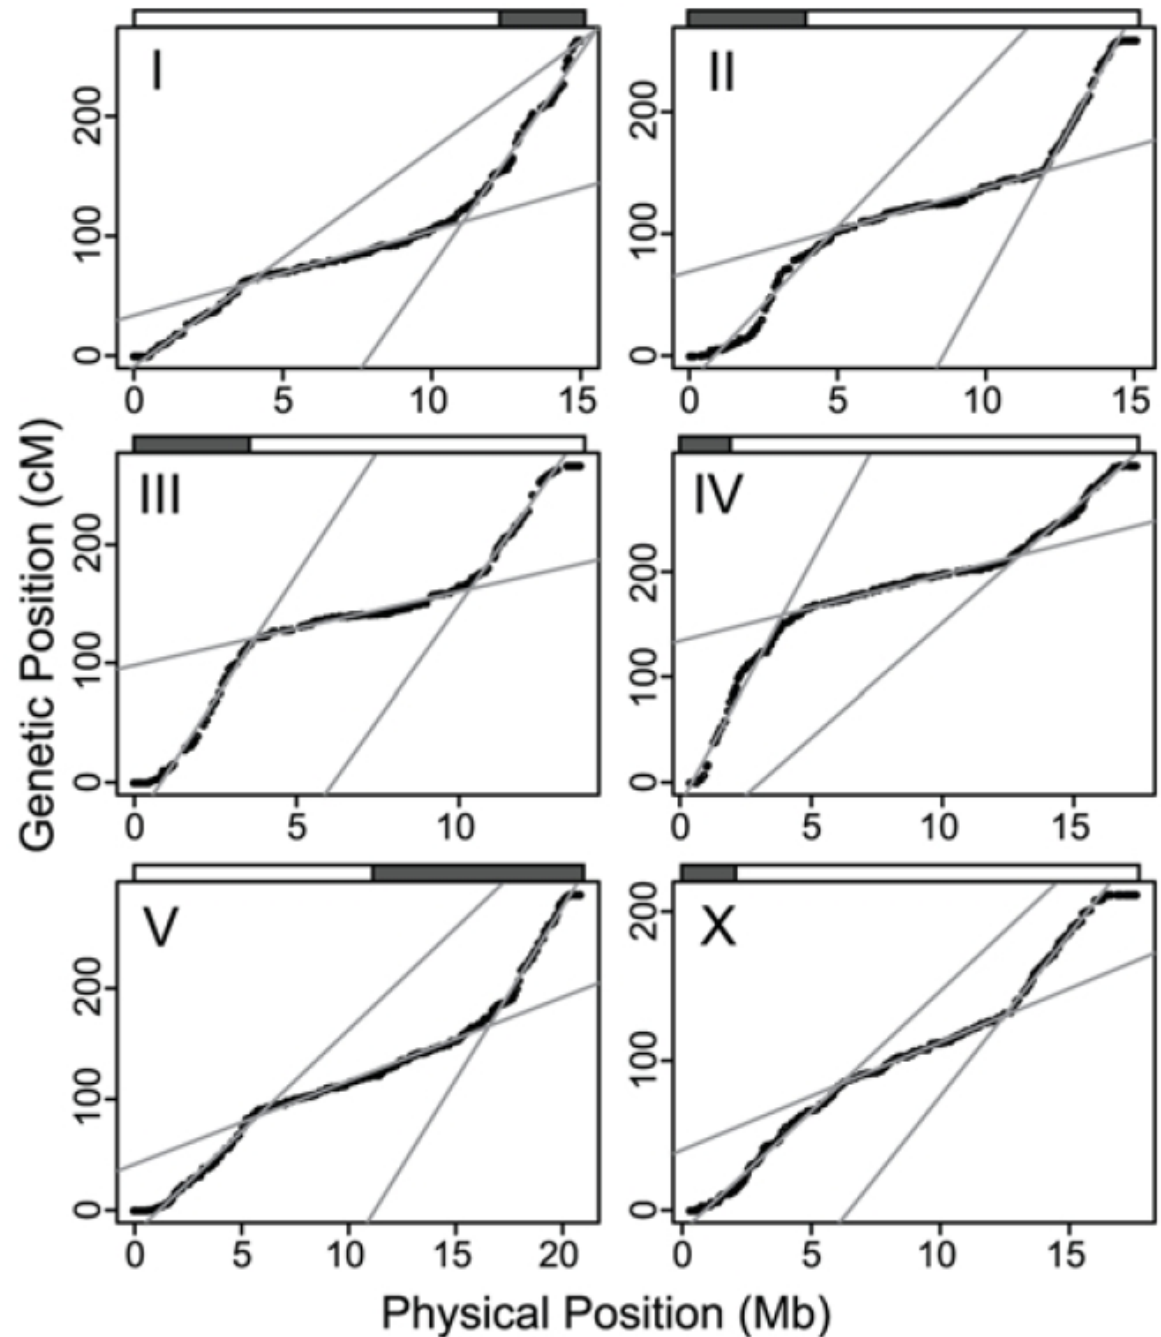

*Citrus sinensis* (orange)

# Alignment of genetic and physical maps

## Marey map

Genetic position was measured in centiMorgans based on a recombinant inbred advanced intercross line population, and not based on meiotic distances.

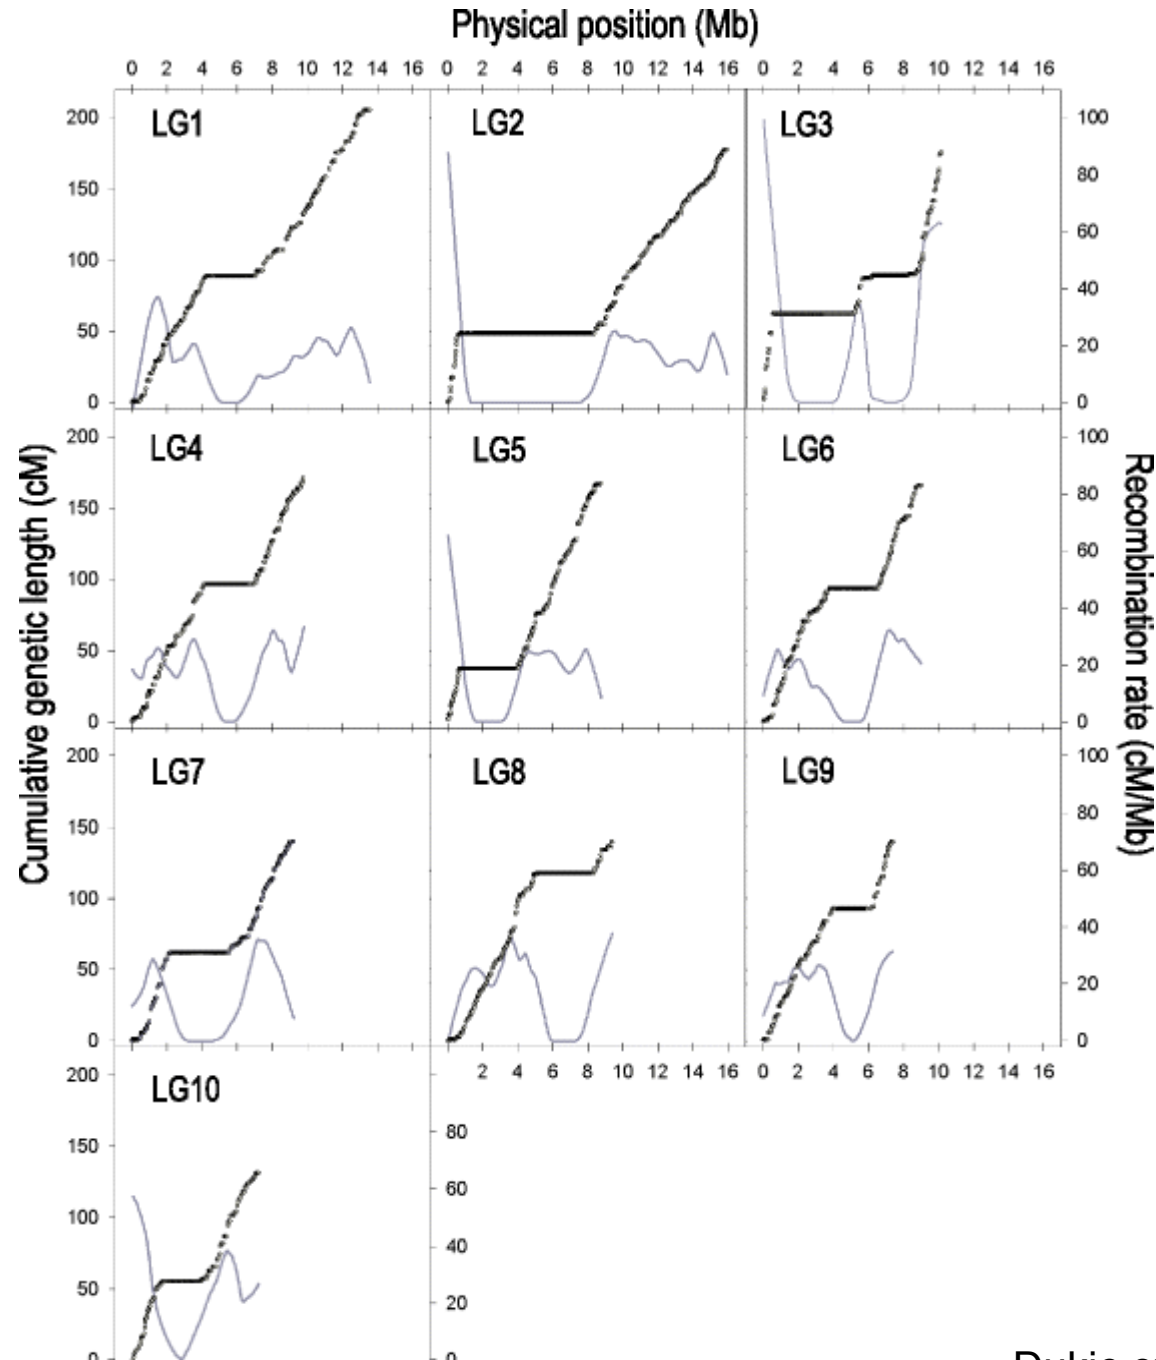

Recombination rate varies along the chromosome

*C. elegans*

Rockman & Kruglyak

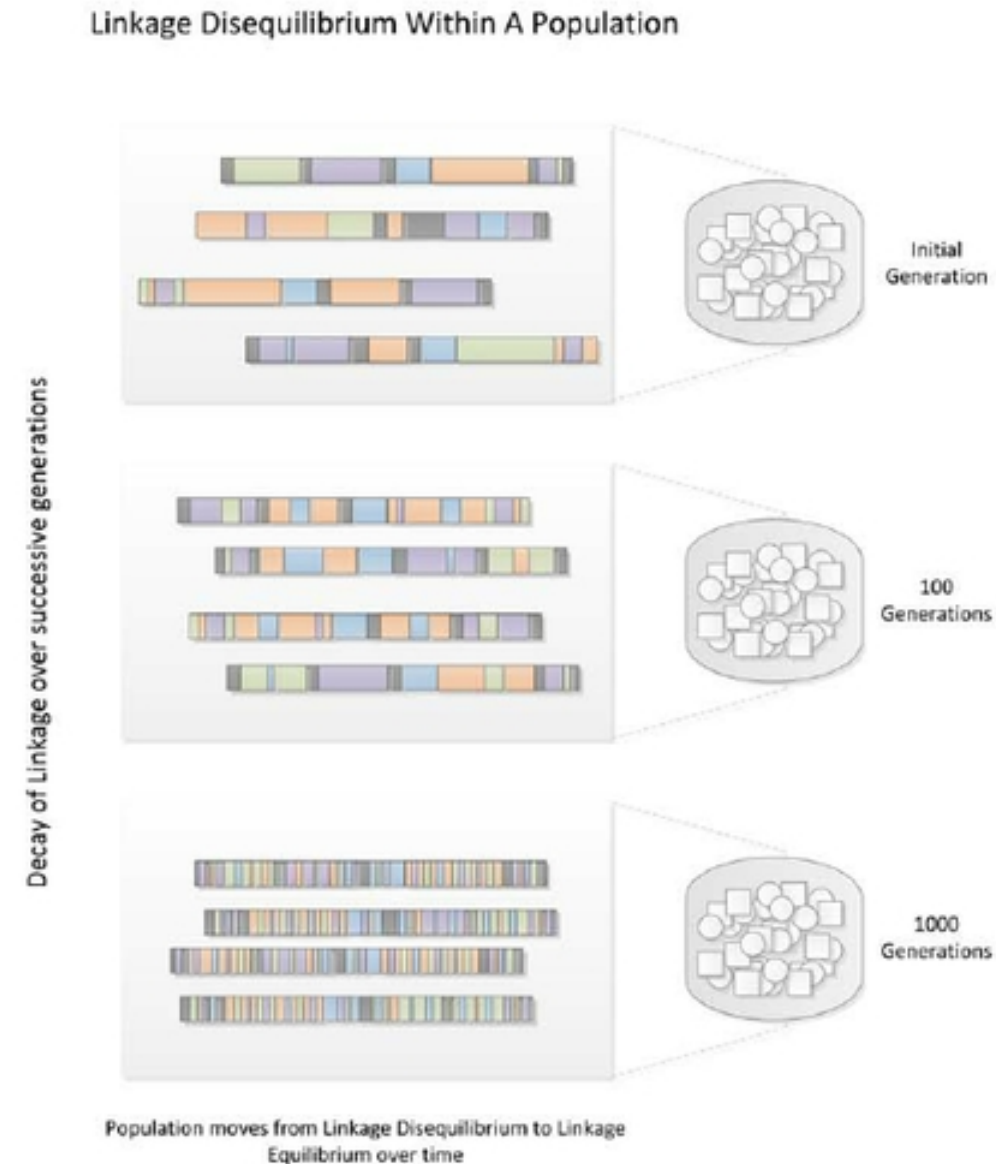

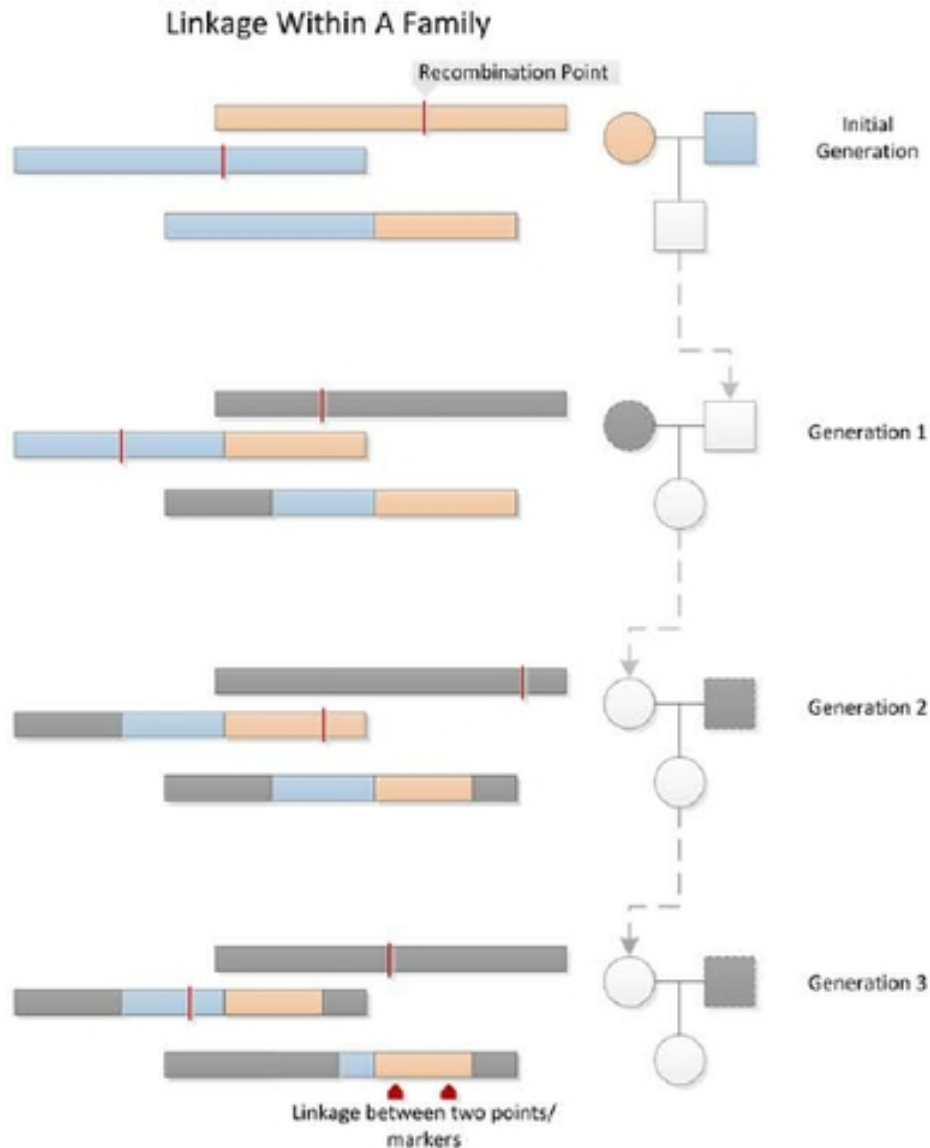

*PLoS Gen* 2009

# Marey maps in *Daphnia*

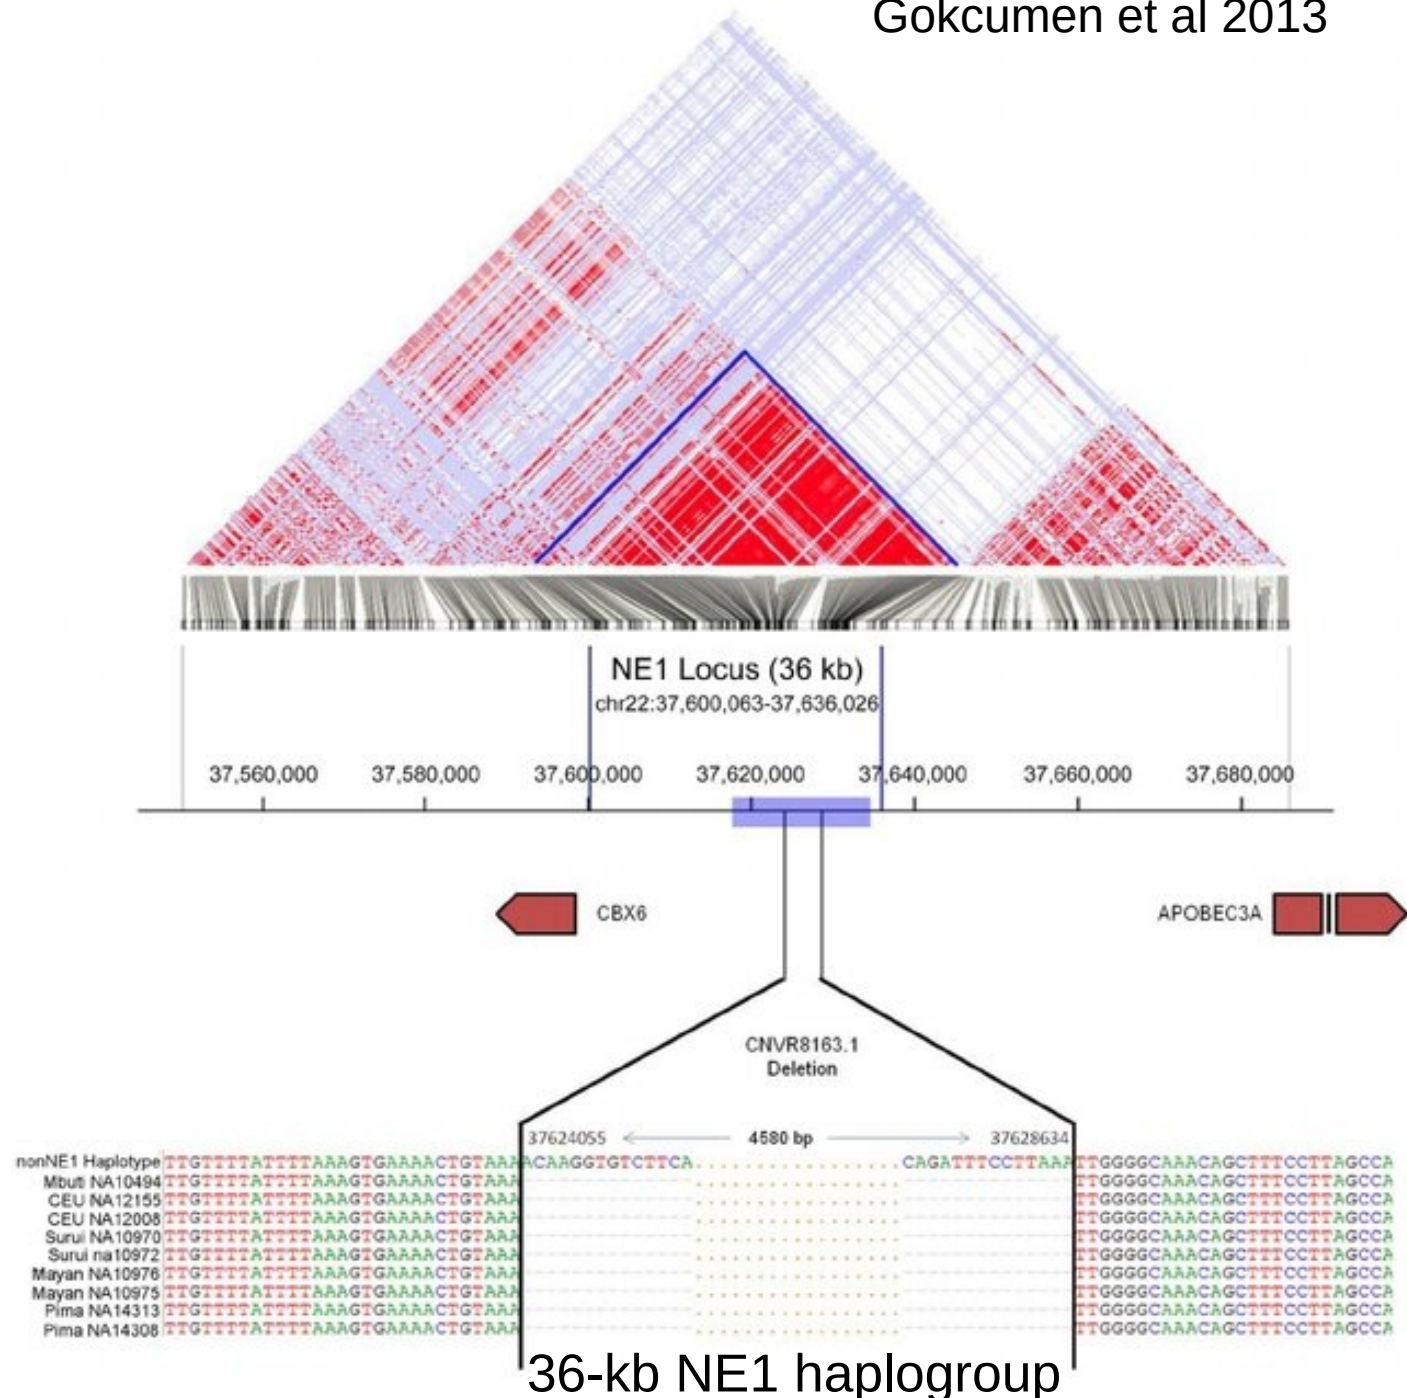

# Linkage disequilibrium (LD)

non-random association of alleles at different loci in a given population

The Linkage Disequilibrium (LD) block was determined using SNP data of the CEU population from 1000 human Genomes

contains a 4.6-kb deletion in perfect linkage disequilibrium with 12 SNP  
aligns with Neandertal haplotype

# Variation in Linkage disequilibrium (LD)

LD is a function of  
age of alleles, outcrossing and recombination rates

Depends on organism and genome region

short-range = 100 bp *D. melanogaster*, *Caenorhabditis remanei*

medium-range = a few kb: *Homo sapiens*, *Arabidopsis thaliana*

long-range = Mb: *Caenorhabditis elegans*

# Epistasis

---

= Non-additive interaction of alleles at different loci  
for a given phenotype

**Allele for  
blond hair**

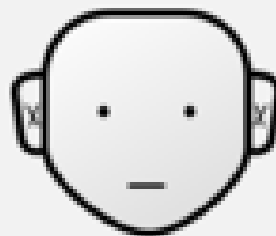

**Blond hair**

**Allele for  
red hair**

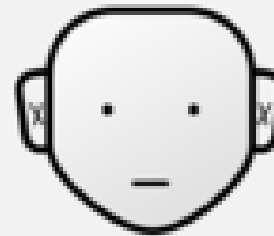

**Red hair**

**Allele for  
baldness**

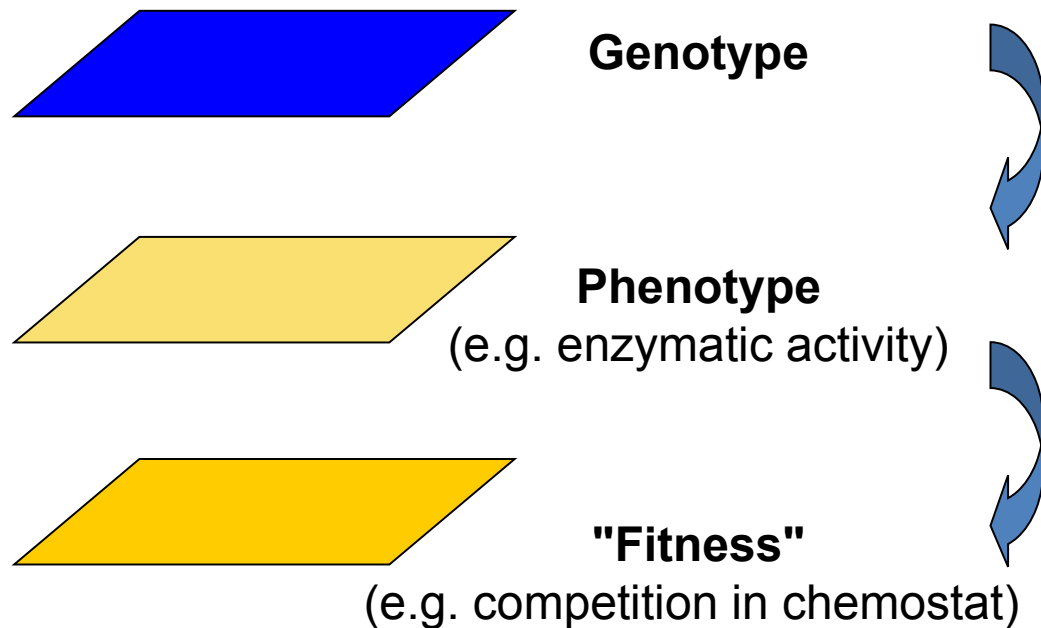

**Bald**

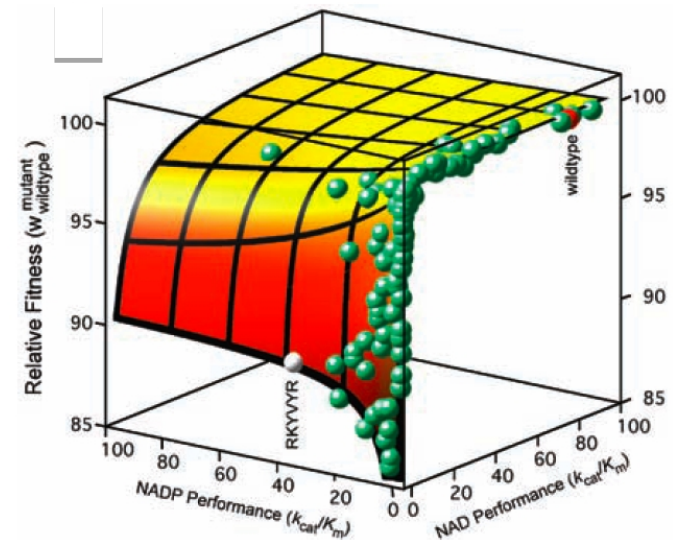

**Bald**

# Additivity at one phenotypic level does not imply additivity at another level

additive

epistasis  
due to enzyme saturation  
=> non-linear relationship

# Various meanings for Epistasis

## Laboratory genetics, with null alleles

$m1$  is epistatic to  $m2$

if  $m1\ m2$  displays the M1 phenotype

=> genetic pathway

## Quantitative / evolutionary genetics

"epistasis" used for "gene interaction"

= non-*additive* effect for any combination (heterozygote, homozygote)

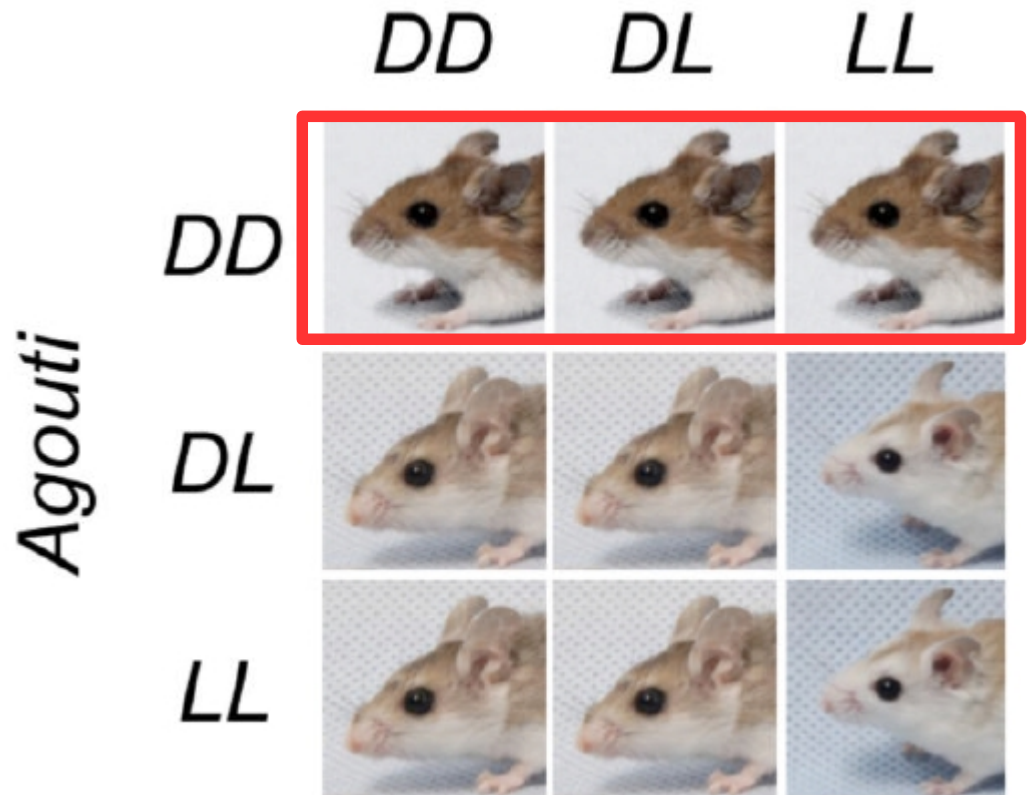

non-additive mapping of genotype space to phenotype space

=> confusion between lab geneticists and evolutionary geneticists

Meaning of "epistasis" depends on the scientific context!

# ***Agouti* (D, L) and *Mc1R* (D,L)**

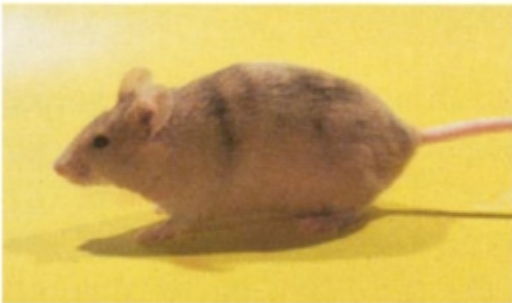

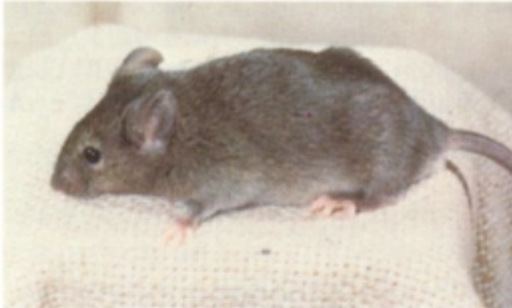

Natural alleles  
3 phenotypes

***Agouti*<sup>D</sup> is epistatic  
over *Mc1R* alleles**

# *Agouti* (A, a) and *Mc1R* (E,e)

Laboratory mutants  
3 phenotypes

*Agouti*

Epistasis between  
beneficial mutations

Antagonistic epistasis

Epistasis between  
deleterious mutations

Antagonistic epistasis

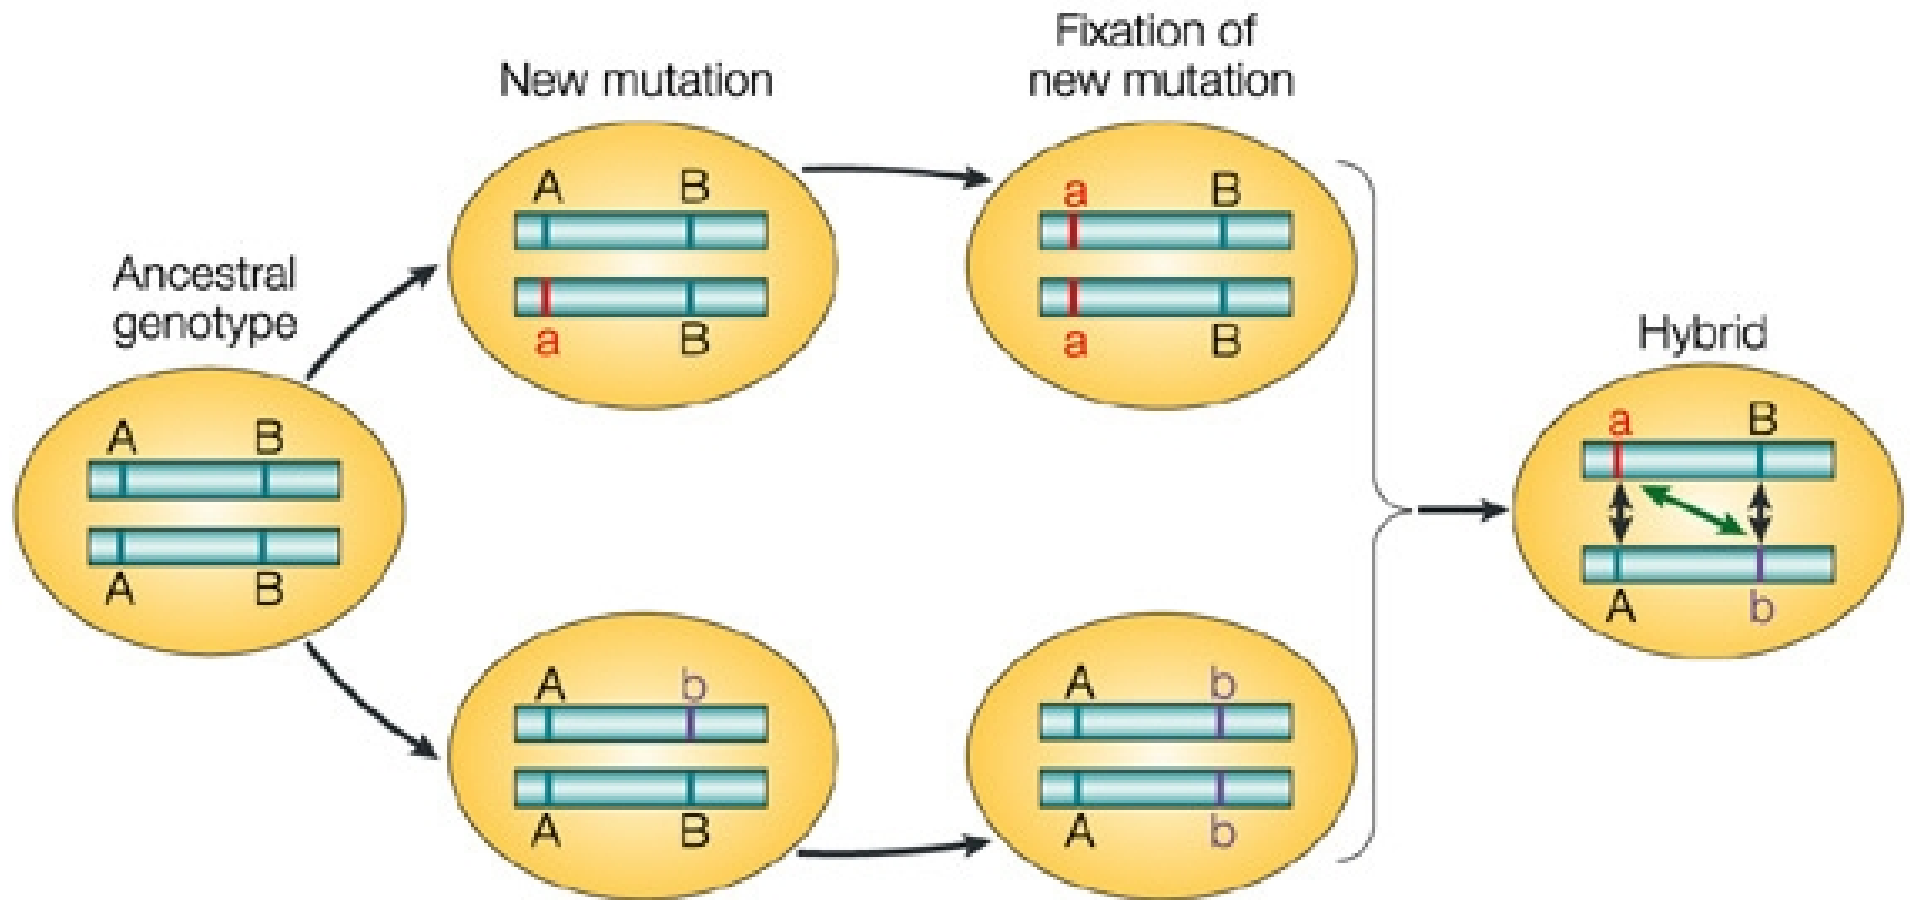

Synergistic epistasis

**"Synergistic epistasis"**: the effects of both alleles  
reinforce each other (more than the sum of their individual effects);  
extreme case: **synthetic phenotype** (new phenotype)

**"Antagonistic epistasis"**: the effects of the two alleles  
partially **compensate** (less than the sum of effects of  $a_2$ ,  $b_2$ )

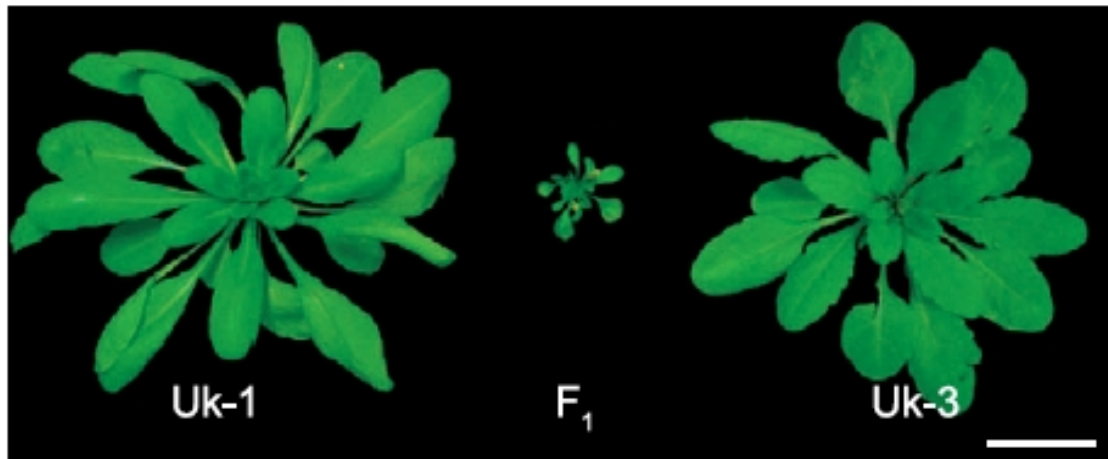

**"Positive or negative epistasis"**: the phenotypic value  
is either increased or decreased relative to additivity

# Dobzhansky-Muller model of hybrid incompatibility A special case of epistasis

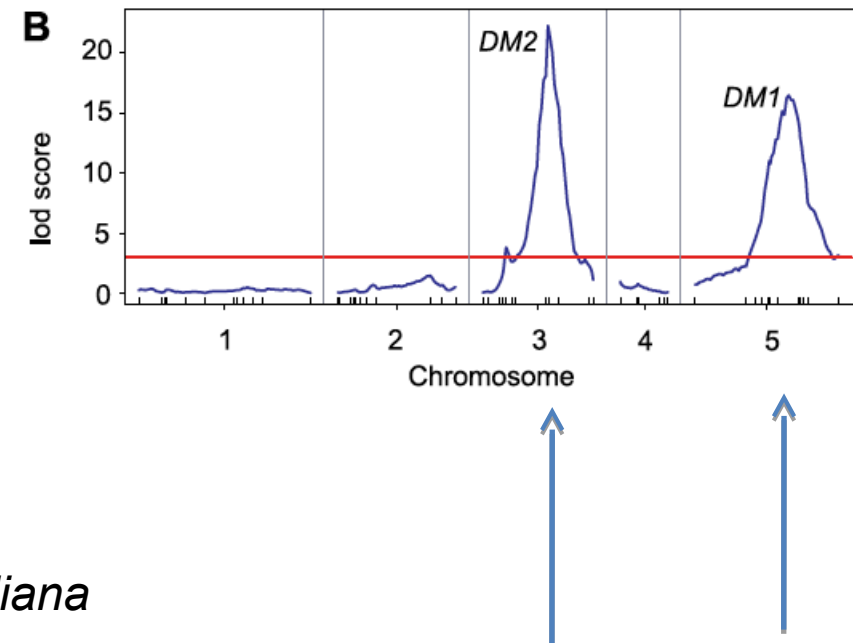

possible mechanism of speciation

# Expressivity of one mutation varies with wild genetic background

*Tcof1*<sup>-/-</sup> heterozygote mice

# Different kinds of GxG interactions

$\underset{m1}{G}$  x  $\underset{m2}{G}$  between 2 laboratory mutations

$\underset{a1/a2}{G}$  x  $\underset{b1/b2}{G}$  between 2 natural alleles

$\underset{m}{G1}$  x  $\underset{m}{G2}$  one mutation  
in different wild genetic backgrounds  
“cryptic” variation

$\underset{a1/a2}{G}$  x  $\underset{b1/b2}{G}$  x  $\underset{c1/c2}{G}$  >2 loci

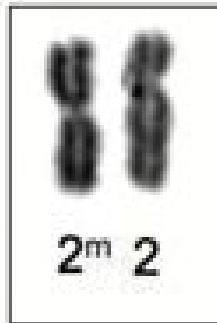

*Gerke et al. 2010*

# **Super genes**

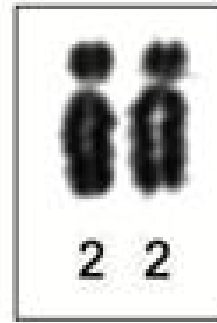

---

# White throated sparrow

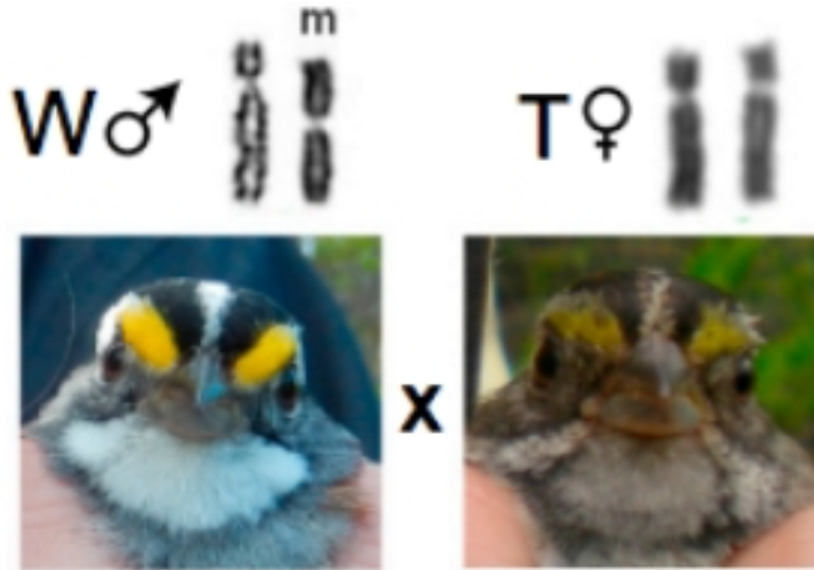

White morph

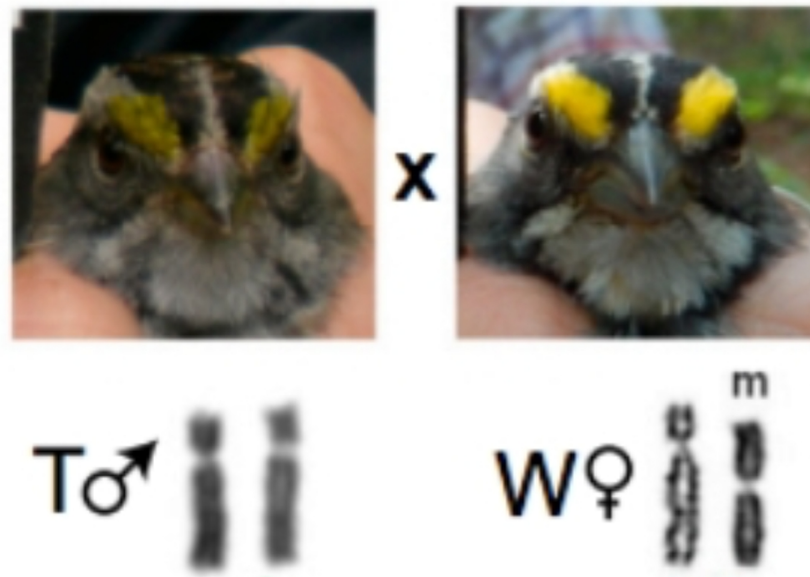

Tan morph

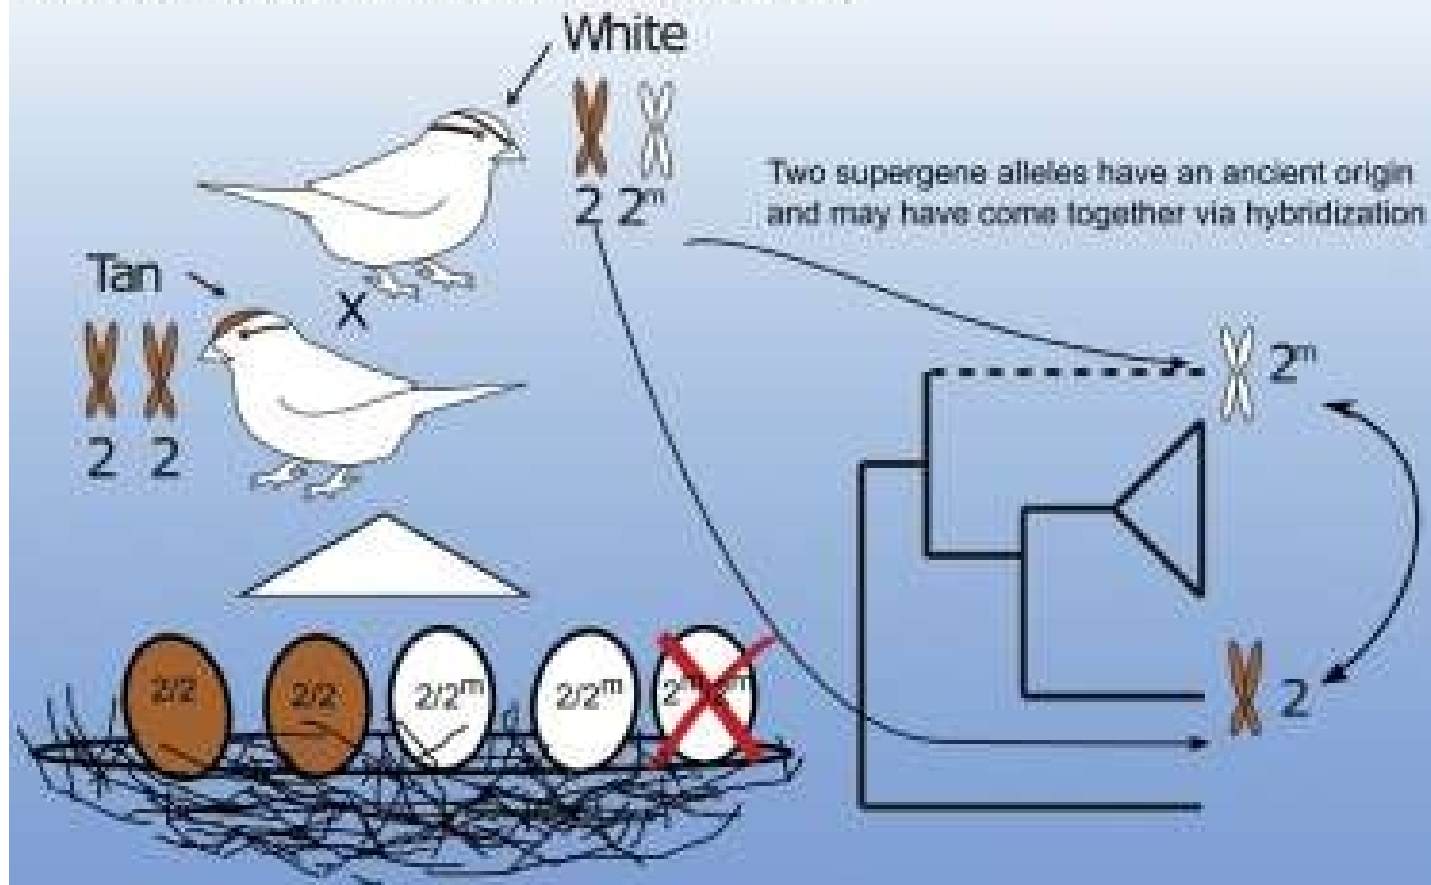

# Disassortative mating

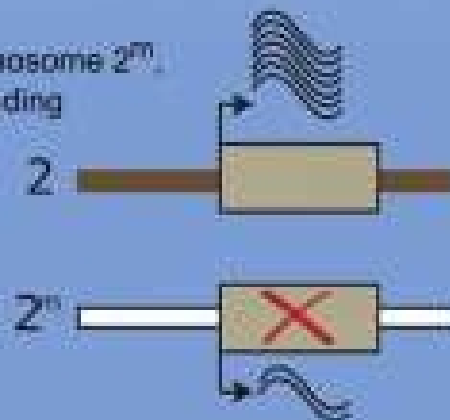

Never W male x W female  
Never T male x T female

Two sparrow morphs are determined by a supergene  
Alternative alleles are maintained by disassortative mating

Due to a lack of recombination on chromosome  $2^m$ ,  
that version of the chromosome is degrading

Rest of Genome

# **Pleiotropy**

---

= when a genetic change affects several phenotypes

# Various meanings for Pleiotropy

## **Pleiotropy of a gene**

(means pleiotropy of the *null* mutation)

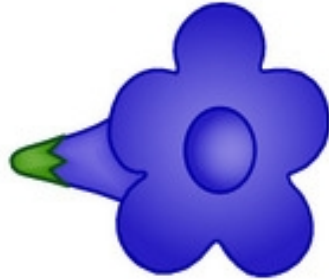

## **Pleiotropy of a cis-regulatory region**

(means pleiotropy of the *deletion* of the region)

## **Pleiotropy of a mutation**

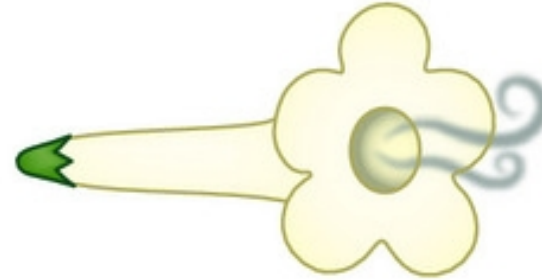

(a)

Parent P1

Short length  
Low scent  
High pigmentation

Parent P2

Long length  
High scent  
Low pigmentation

(b)

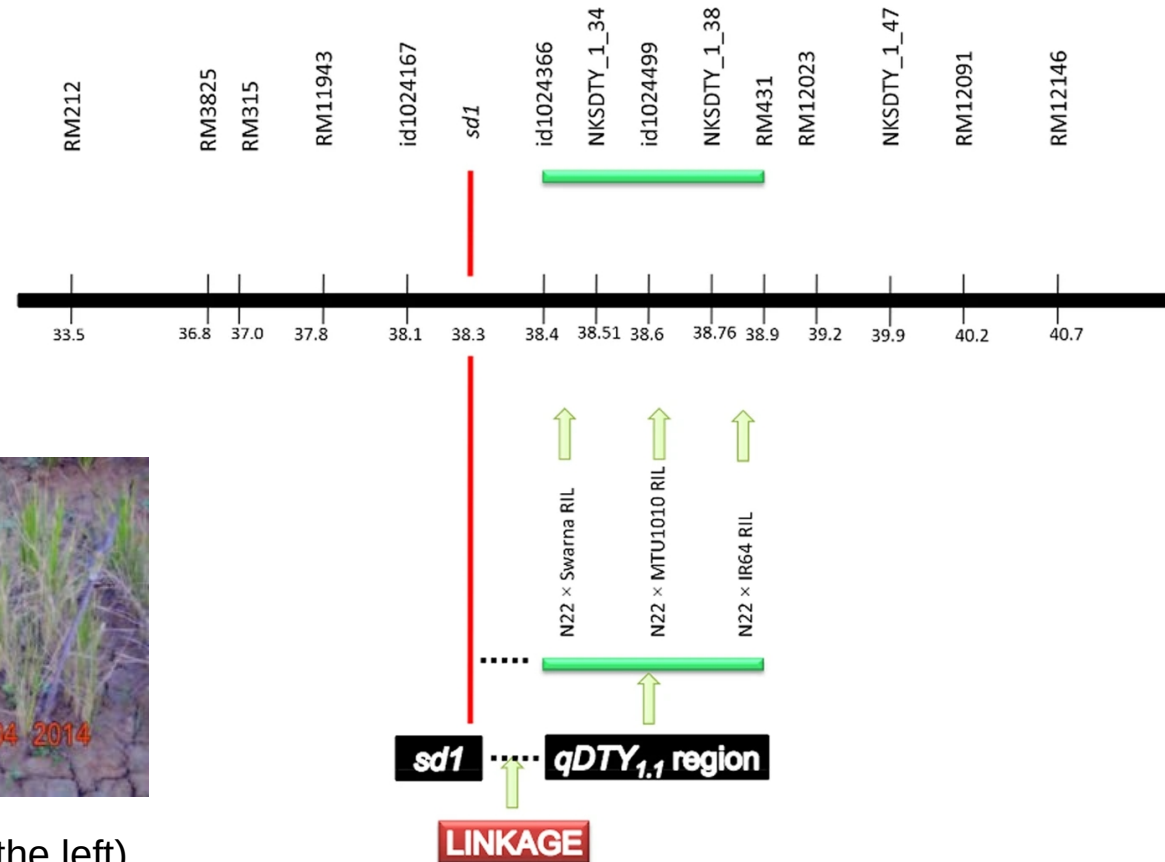

|      | Length | Scent | Pigmentation |                         |
|------|--------|-------|--------------|-------------------------|
| QTL1 | ↑      |       |              | No measured pleiotropy  |
| QTL2 | ↑      | ↓     | ↓            | Antagonistic pleiotropy |
| QTL3 | ↑      | ↑     | ↓            | Adaptive pleiotropy     |

# Modern rice varieties are sensitive to drought

*sd1* locus  
(dwarf size)  
close to the  
*QDTY1.1* locus  
(grain yield under drought)

Lines with tolerant allele of *qDTY1.1* QTL (on the left) remained green while those with sensitive allele (on the right) were severely affected under vegetative stage drought at IGKV, Raipur. Both the lines were of dwarf stature due to presence of *sd1* allele.
